[301] Strings

Tyler Caraza-Harter

Learning Objectives Today

String Basics

- Comparison
- Common functions

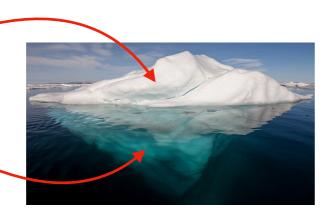

Method Syntax

Sequences (a string is an example of a sequence)

- len
- indexing
- slicing
- for loop

what we've learned about strings so far

what we'll learn today ~

Chapter 8+9 of Think Python

Today's Outline

Comparison

String Methods

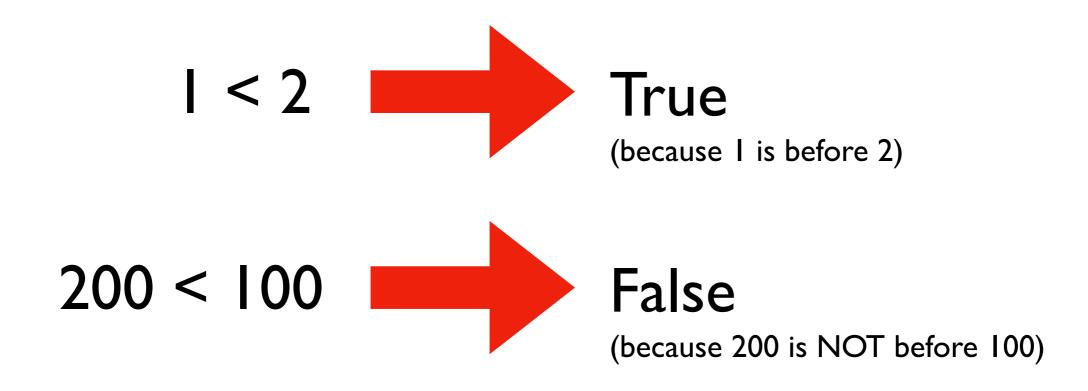

Sequences

Slicing

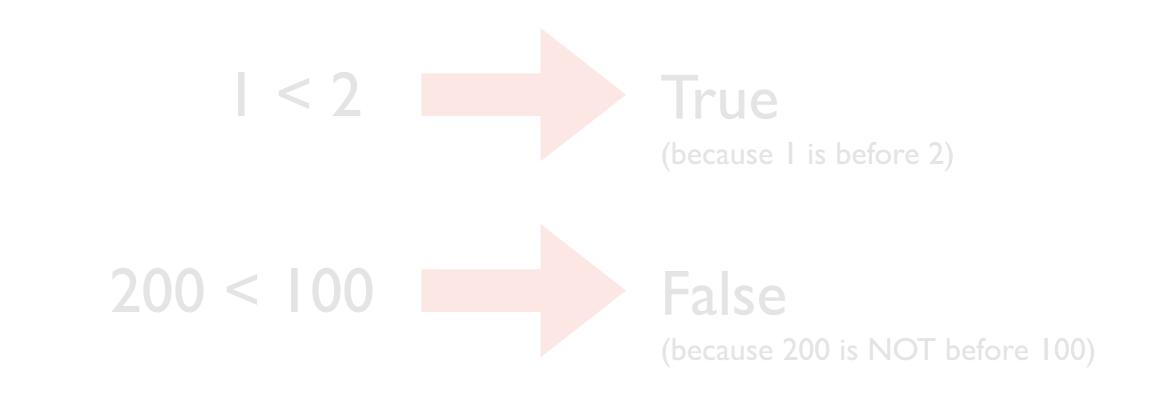

for loop over sequence

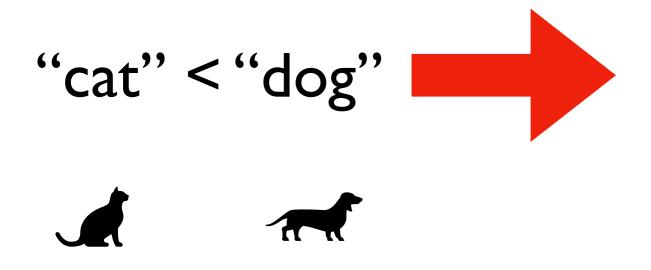

for loop over range

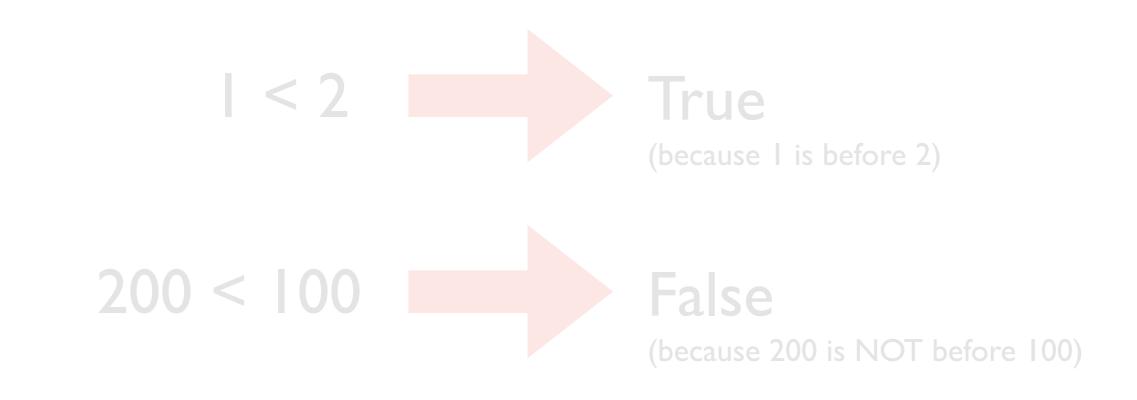

Python can also compare strings

"cat" < "dog"

X

True (because "cat" is before "dog" in the dictionary)

Python can also compare strings

What about strings that start with the same letter?

What about strings that start with the same letter?

Look for the first letter that's different, and compare those.

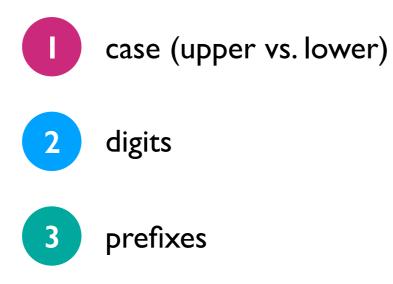

What about strings that start with the same letter?

Look for the first letter that's different, and compare those.

Comparison

There are three gotchas:

I. Case rules

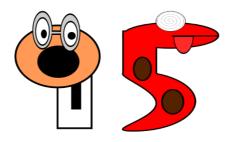

"a" < "b" < ... < "y" < "z"

makes sense

upper case is before lower

less intuitive

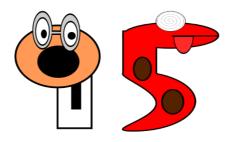

"8" < "9"

makes sense

"||" < "2" "|00" < "|5"

less intuitive

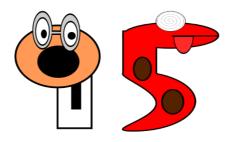

"8" < "9"

makes sense

remember to find the FIRST difference, and base everything on that

"8" < "9"

makes sense

remember to find the FIRST difference, and base everything on that

3. Prefixes

String 1: bat String 2: batman

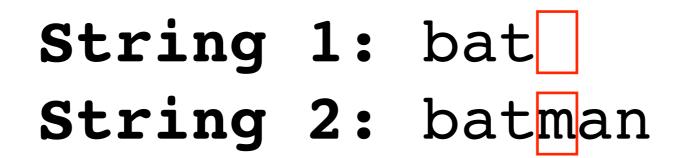

3. Prefixes

String 1: bat String 2: batman

3. Prefixes

"" < "m", so String I is first:

"bat" < "batman"

Do problem I

Today's Outline

Comparison

String Methods

Sequences

Slicing

for loop over sequence

for loop over range

A special function associated variable/value

```
>>> msg = "hello"
>>>
```

A special function associated variable/value

```
>>> msg = "hello"
>>> len(msg)
```

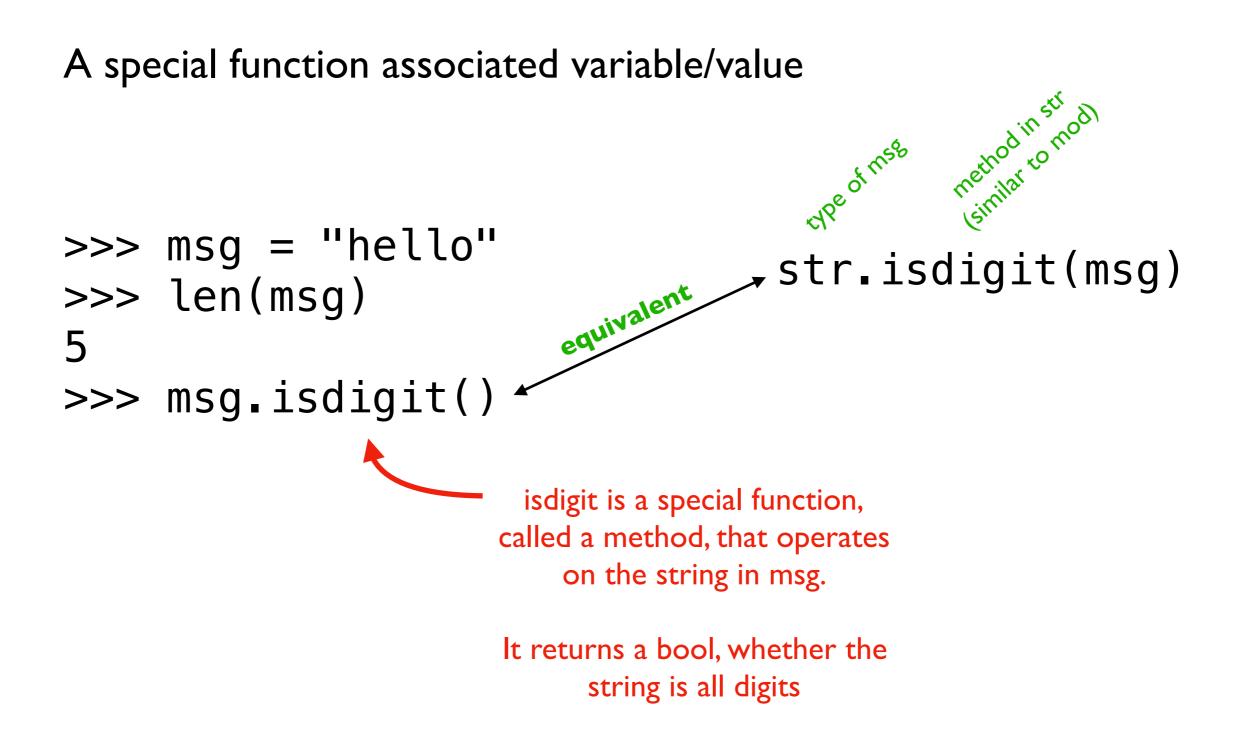

len is a normal function, it returns number of characters in string.

It returns the number of characters in a string

A special function associated variable/value

```
>>> msg = "hello"
>>> len(msg)
5
>>>
```

A special function associated variable/value

A special function associated variable/value

```
>>> msg = "hello"
>>> len(msg)
5
>>> msg.isdigit()
False
>>>
```

A special function associated variable/value

```
>>> msg = "hello"
>>> len(msg)
5
>>> msg.isdigit()
False
>>>
```

Both the regular function (len) and method (isdigit) are answering a question about the string in msg, but we call them slightly differently

A special function associated variable/value

```
>>> msg = "hello"
>>> len(msg)
5
>>> msg.isdigit()
False
>>> msg.upper()
'HELL0'
is upper a regular function or a method?
```

A special function associated variable/value

```
>>> msg = "hello"
>>> len(msg)
5
>>> msg.isdigit()
False
>>> msg.upper()
'HELLO'
```

methods can be called with literal values as well as with values in variables

A special function associated variable/value

```
>>> msg = "hello"
>>> len(msg)
5
>>> msg.isdigit()
False
>>> msg.upper()
'HELLO'
```

methods can be called with literal values as well as with values in variables

A special function associated variable/value

```
>>> msg = "hello"
>>> len("301")
3
>>> "301".isdigit()
True
>>> "Hello World".upper()
'HELLO WORLD'
```

methods can be called with literal values as well as with values in variables

String Method	Purpose
s.upper()	change string to all upper case
s.lower()	opposite of upper()
s.strip()	remove whitespace (space, tab, etc) before and after
s.lstrip()	remove whitespace from left side
s.rstrip()	remove whitespace from right side
s.format(args)	replace instances of "{}" in string with args
s.find(needle)	find index of needle in s
s.startswith(prefix)	does s begin with the given prefix?
s.endswith(suffix)	does s end with the given suffix?
s.replace(a, b)	replace all instances of a in s with b

Quick demos in interactive mode...

Do problem 2

Today's Outline

Comparison

String Methods

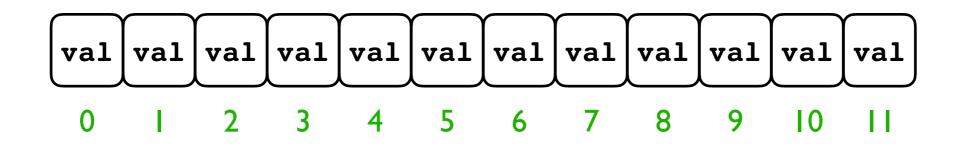

Sequences

Slicing

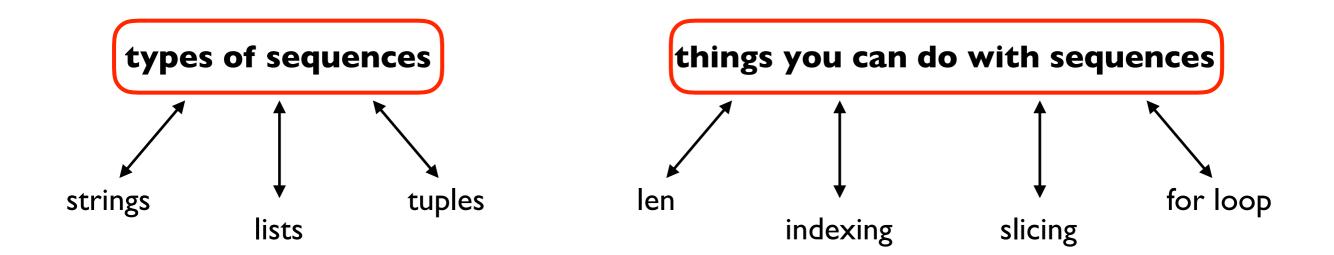

for loop over sequence

for loop over range

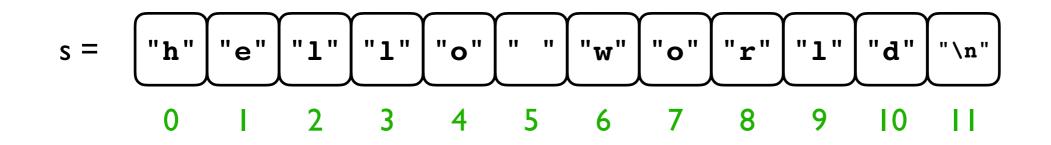

Python Sequences

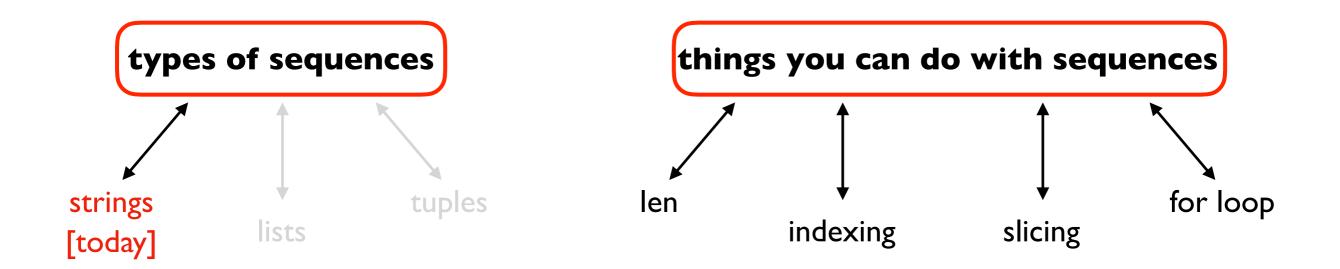

Definition: a sequence is a collection of numbered/ordered values

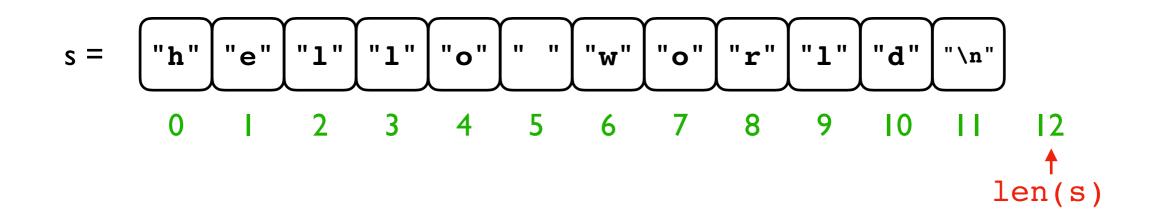

Python Sequences

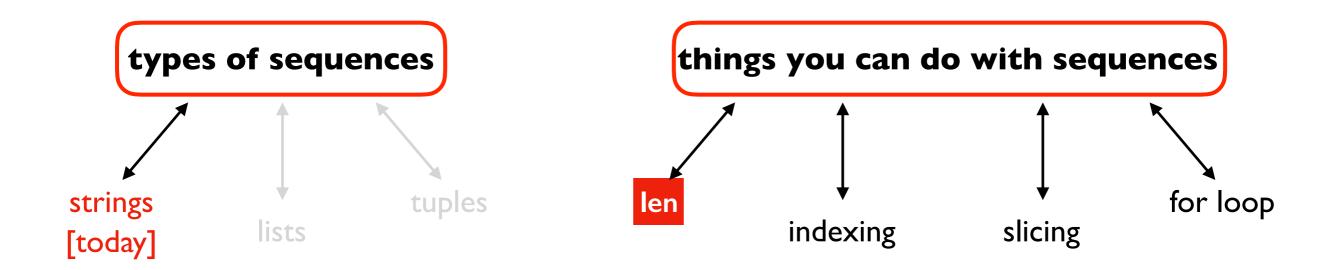

Definition: a string is a sequence of one-character strings

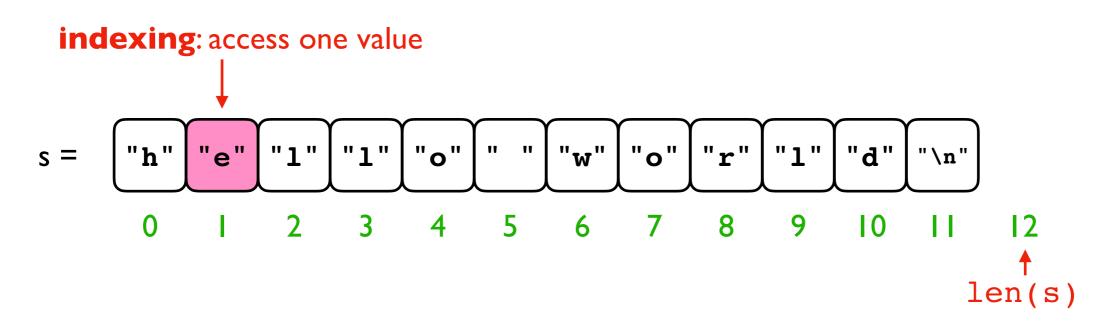

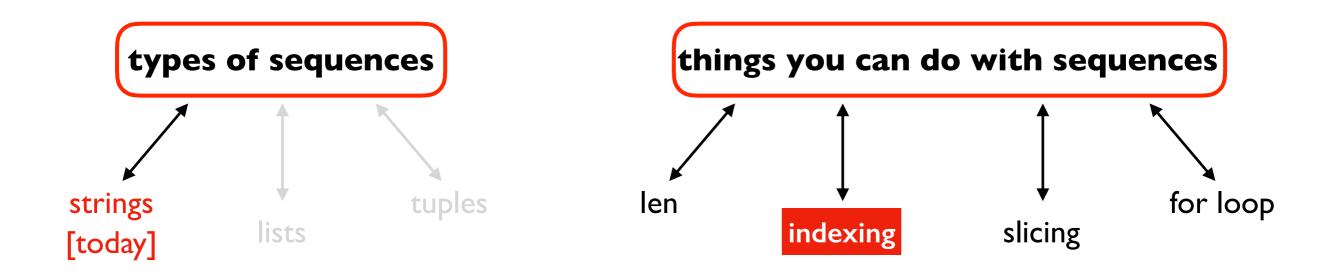

Python Sequences

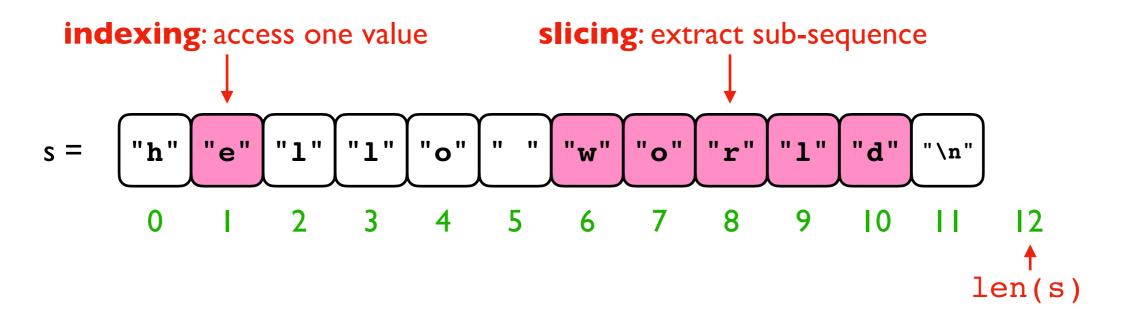

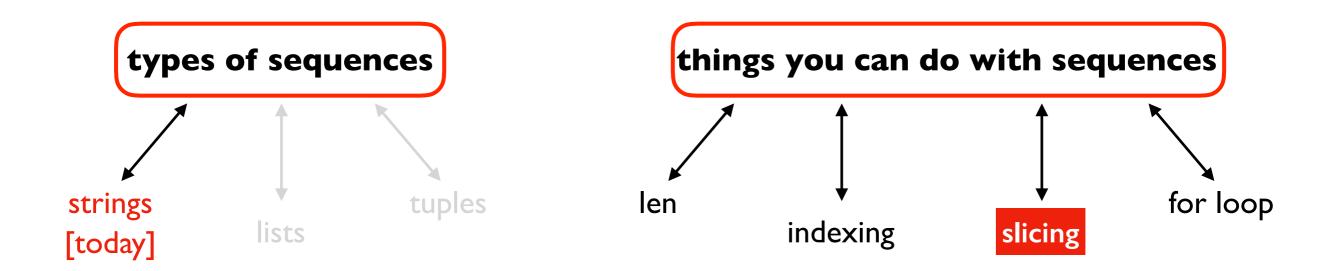

Definition: a string is a sequence of one-character strings

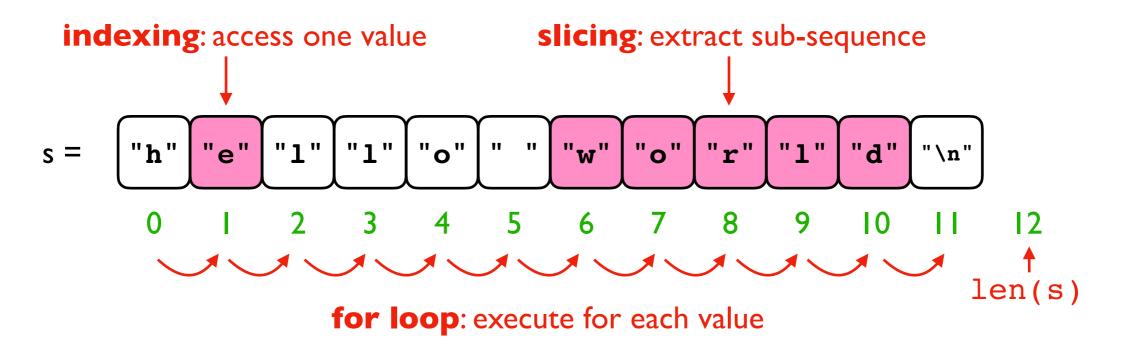

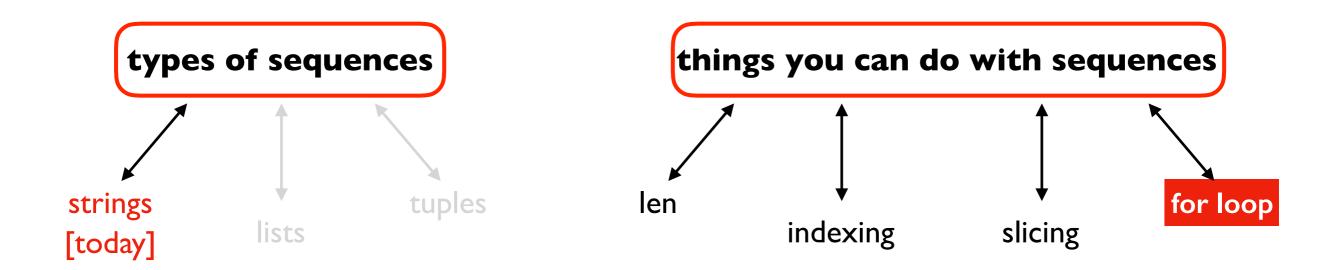

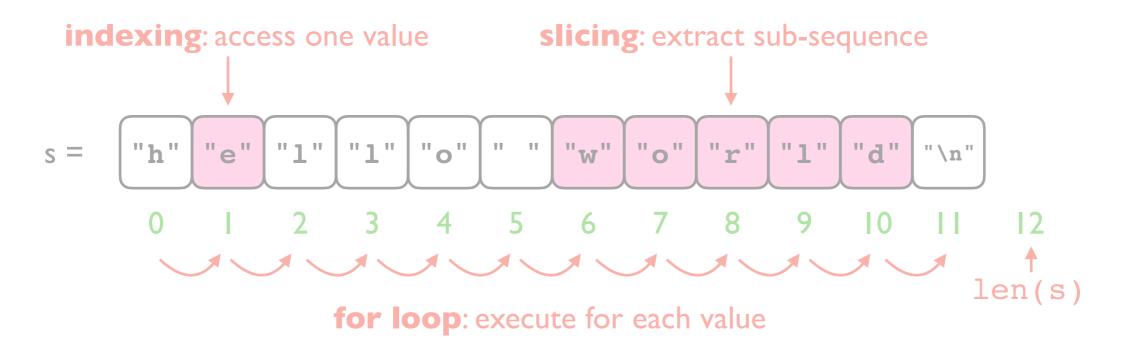

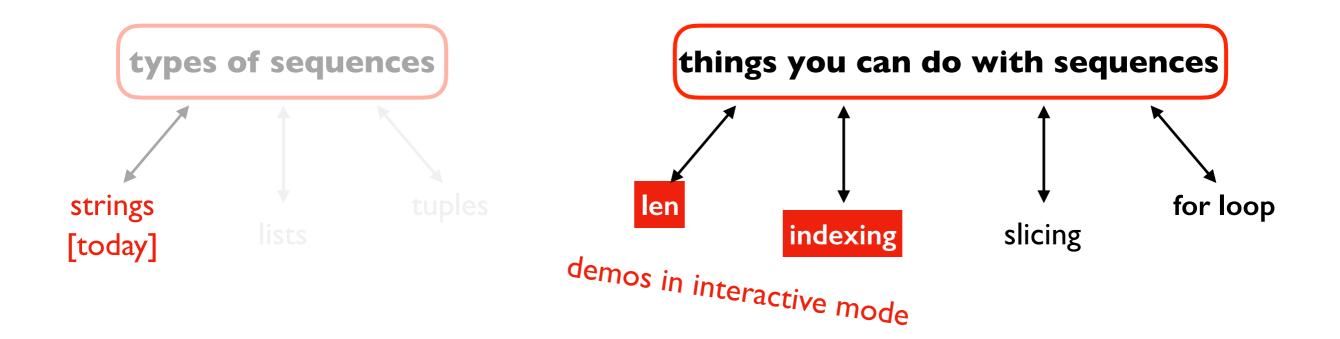

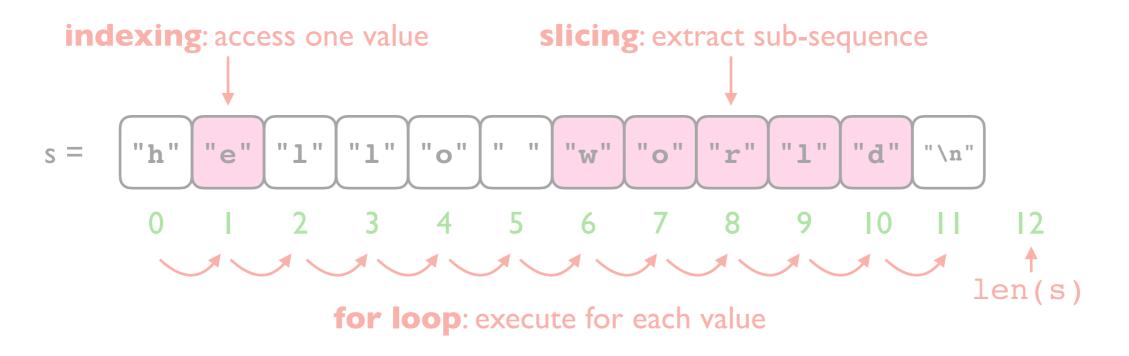

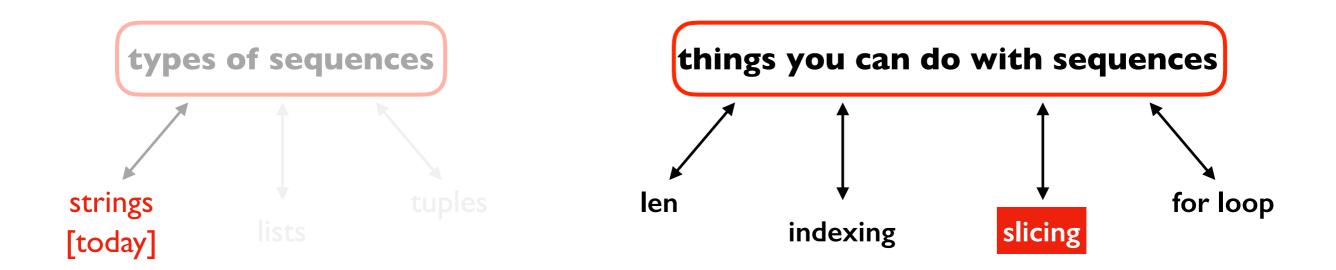

Do problem 3

Today's Outline

Comparison

String Methods

Sequences

Slicing

for loop over sequence

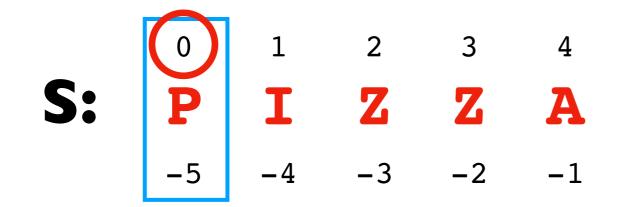

for loop over range

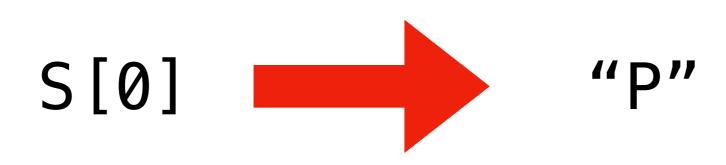

0 1 2 3 4 S: P I Z Z A

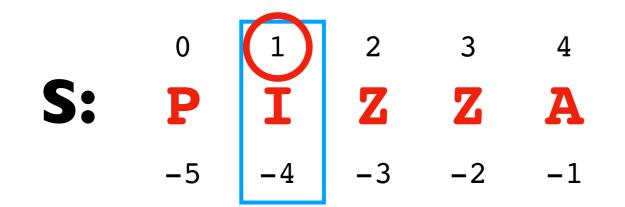

Code:

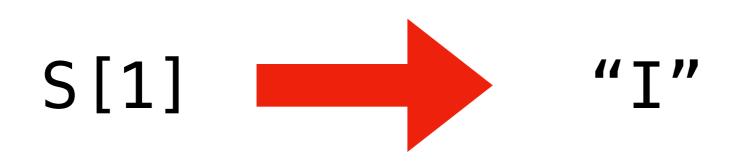

S = "PIZZA"

0 1 2 3 4 S: P I Z Z A -5 -4 -3 -2 -1

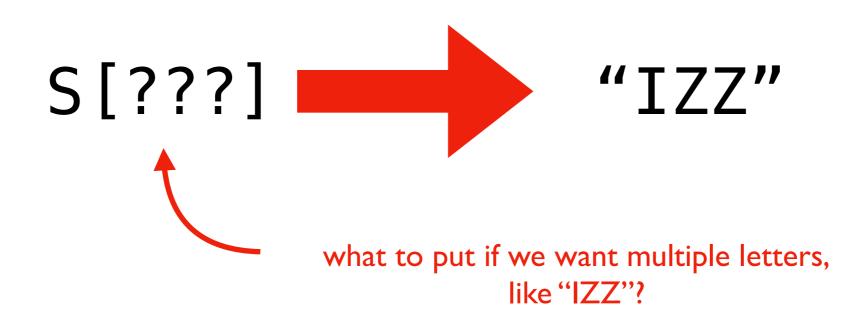

"A"

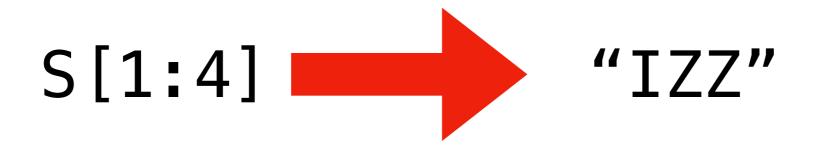

0 3 1 2 4 S: Z Ζ P A Ι -5 -3 -1 -2 -4

 0
 1
 2
 3
 4

 S:
 P
 I
 Z
 Z
 Z
 A

 -5
 -4
 -3
 -2
 -1

4 1 2 0 3 S: Z P Ζ A -1 -5 -3 -2 -4

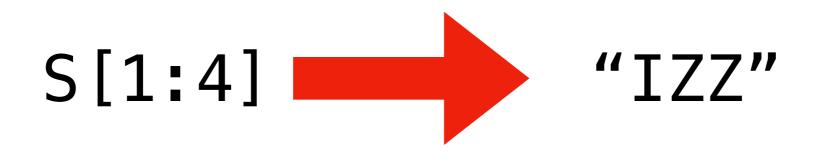

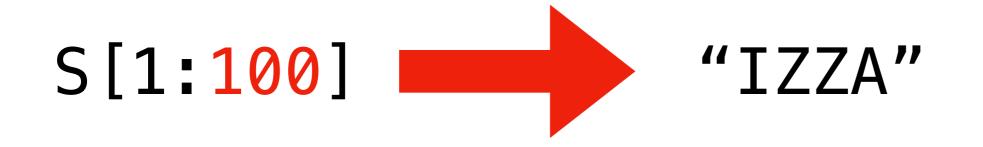

start is "inclusive" end is "exclusive"

1 2 0 3 4 S: Z Ζ P -3 -5 -2

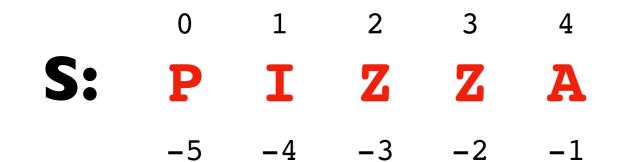

Many different slices give the same result: S[1:4] == S[1:-1] == S[-4:4] == S[-4:-1]

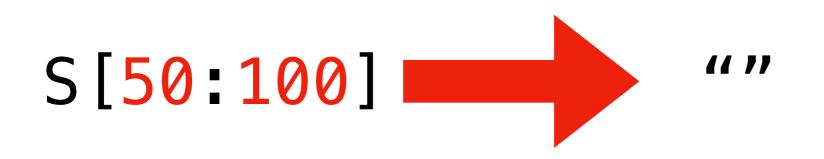

0

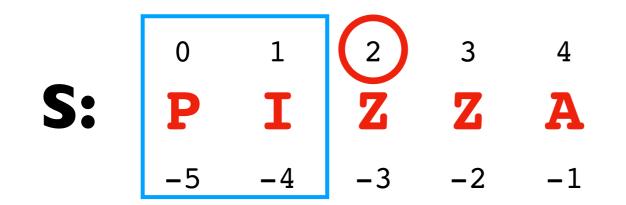

Slices don't complain about out-of-range numbers. You just don't get data for that part

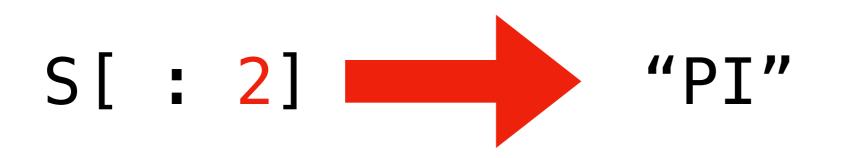

0

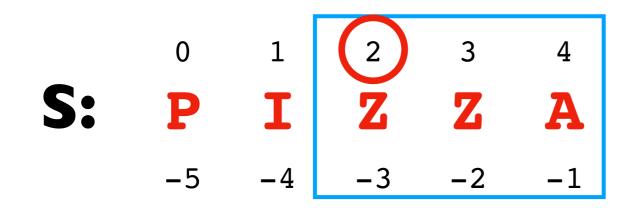

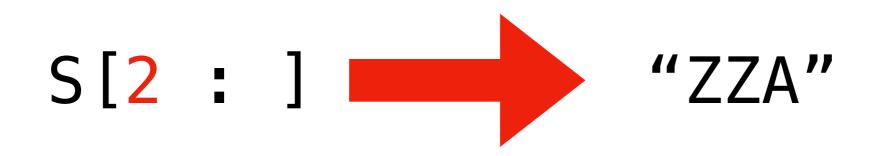

Slices don't complain about out-of-range numbers. You just don't get data for that part

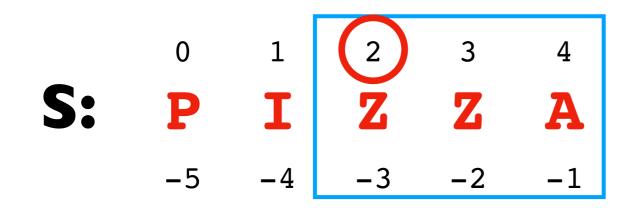

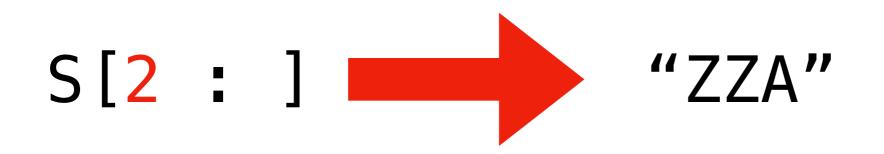

Feel free to leave out one of the numbers in the slice

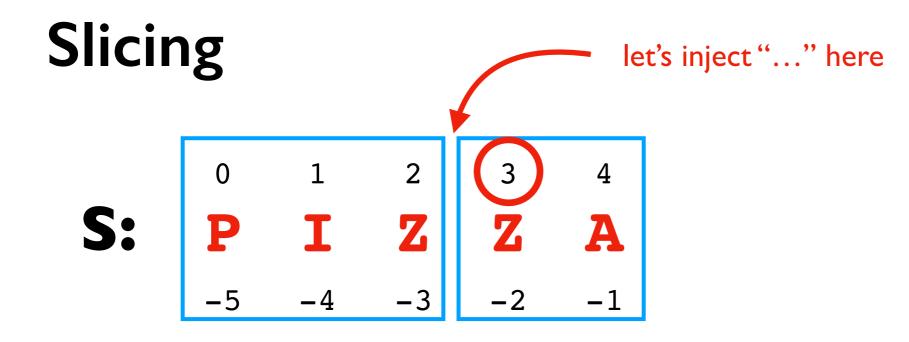

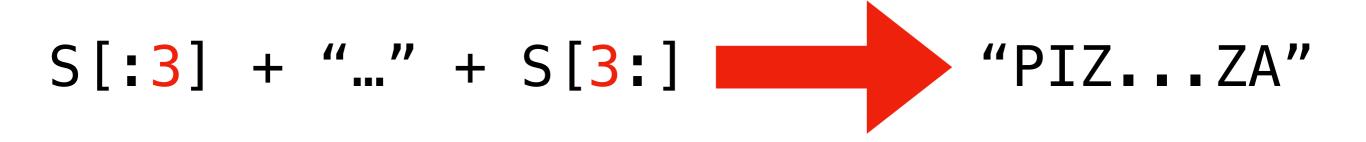

Feel free to leave out one of the numbers in the slice

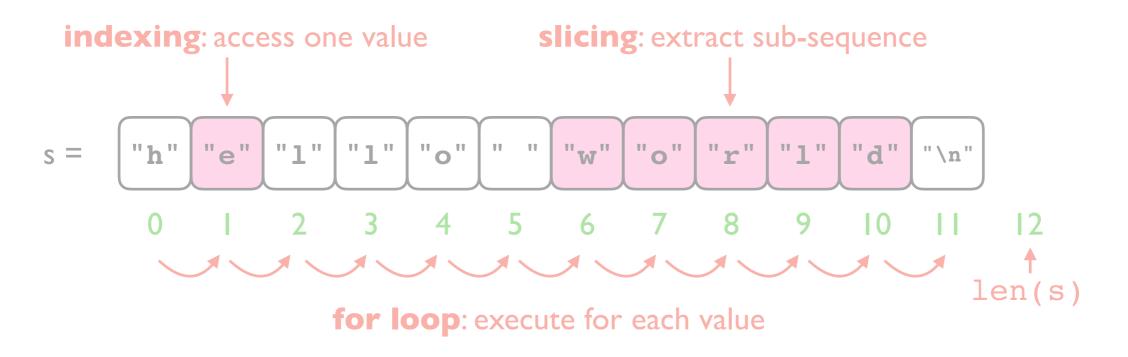

Inclusive start and exclusive end makes it easier to split and inject things

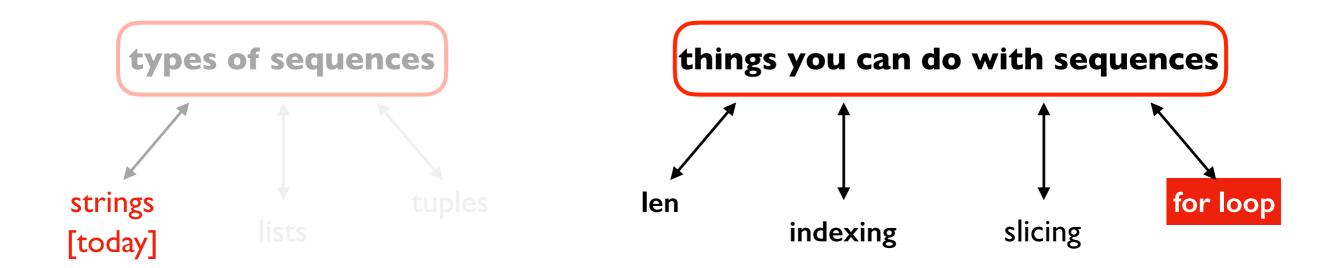

Inclusive start and exclusive end makes it easier to split and inject things

Do problem 4

Today's Outline

Comparison

String Methods

Sequences

Slicing

for loop over sequence

for loop over range

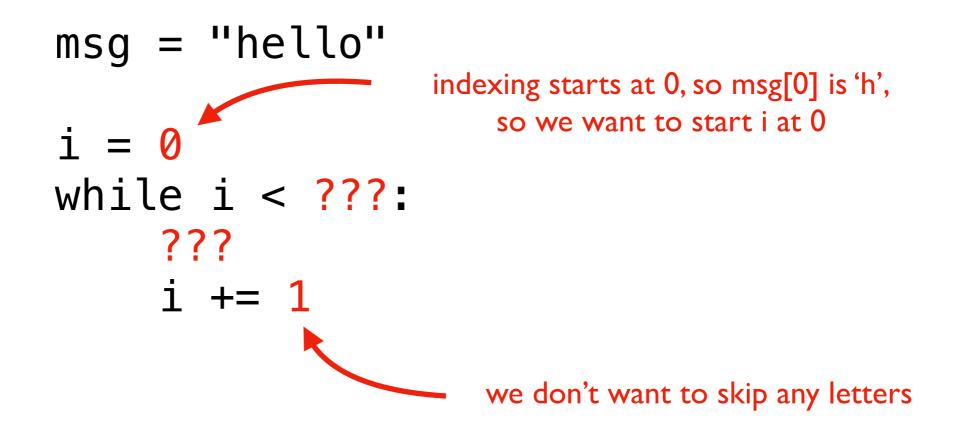

msg = "hello"

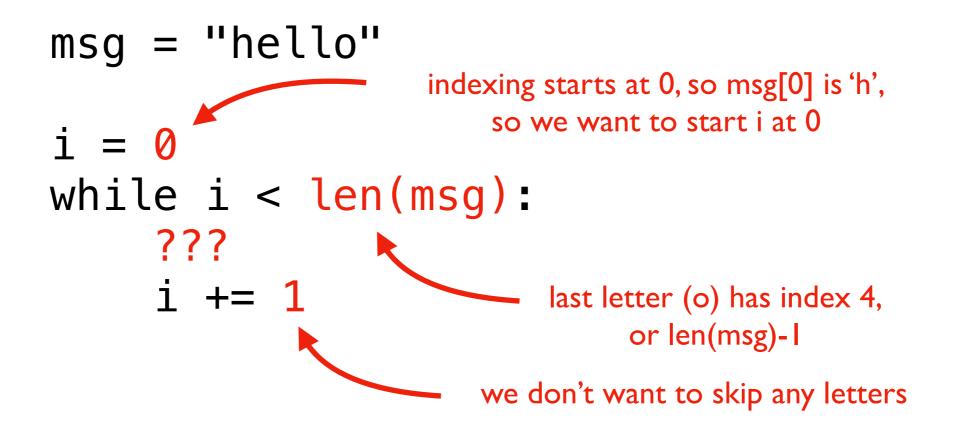

let's say we want to print
each letter on its own line

msg = "hello"
i = ???
while i < ???:
 ???
 i += ???</pre>

msg = "hello"
indexi
i = 0
while i < ???:
???
i += ???</pre>

indexing starts at 0, so msg[0] is 'h', so we want to start i at 0

msg = "hello"
i = 0
while i < len(msg):
 letter = msg[i]
 ???
 i += 1
get the letter for the current index</pre>

```
msg = "hello"
i = 0
while i < len(msg):
    letter = msg[i]
    print(letter)
    i += 1</pre>
```

this is the only interesting part (we just want to print each letter!)

```
msg = "hello"
i = 0
while i < len(msg):
    letter = msg[i]
    print(letter)
    i += 1</pre>
```

this is the only interesting part (we just want to print each letter!)

Code like this for sequences is so common that Python provides an easier way, with the **for loop**

while vs. for

while

loop

```
msg = "hello"
i = 0
while i < len(msg):
    letter = msg[i]
    print(letter)
    i += 1</pre>
```

while vs. for

while

loop

they do the same thing!

while vs. for

for for letter in msg: loop for letter in msg:

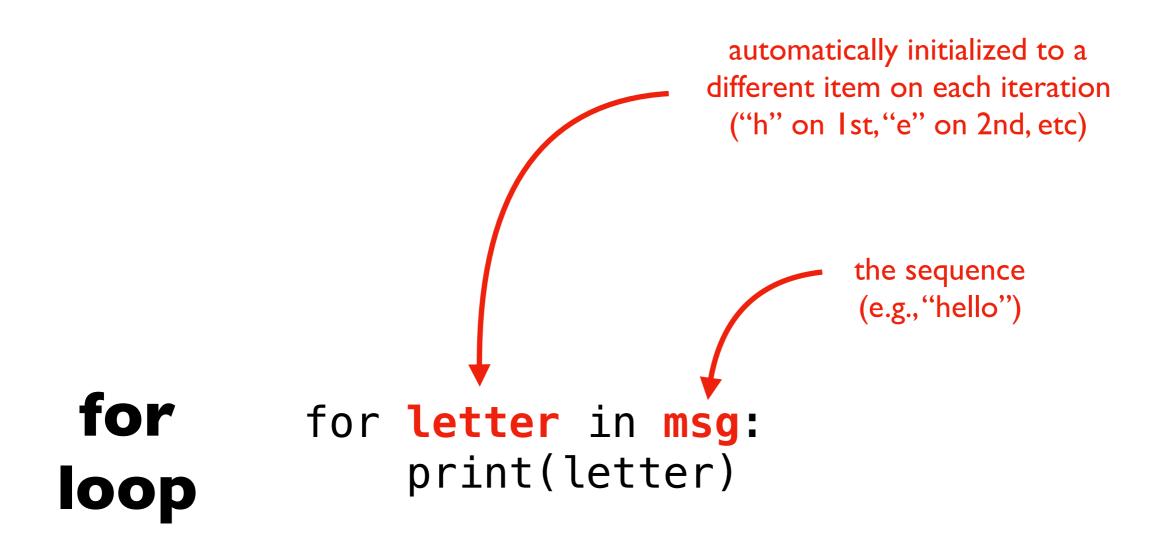

they do the same thing!

for syntax

for for letter in msg: print(letter)

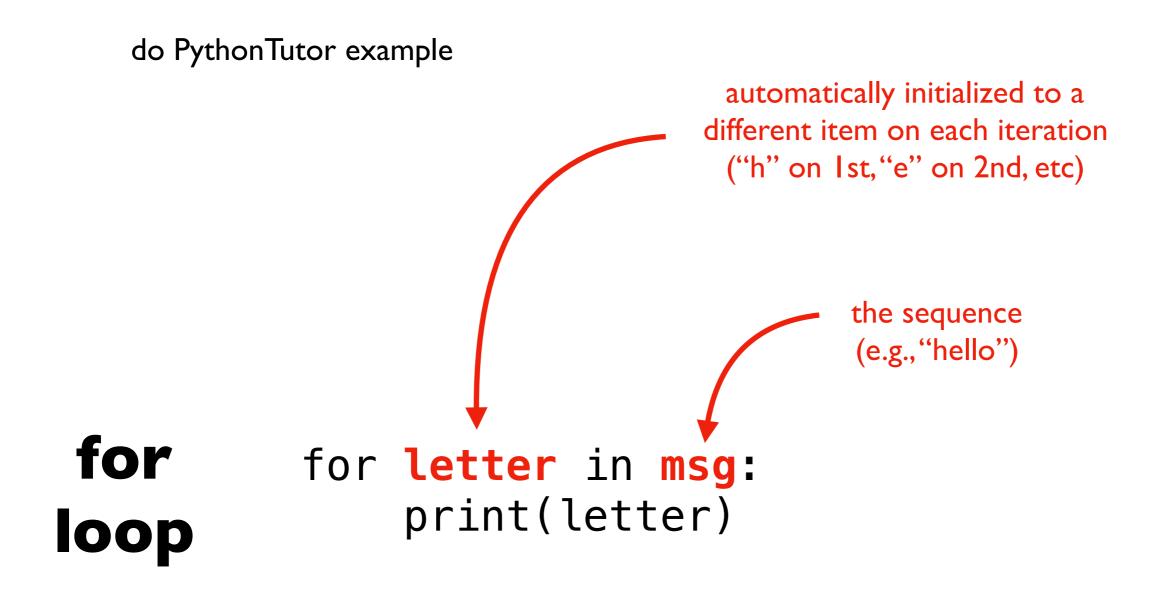

basic syntax always used

for syntax

specify a variable name to use inside the loop, and the sequence you want to loop over

for syntax

specify a variable name to use inside the loop, and the sequence you want to loop over

Do problem 5

Today's Outline

Comparison

String Methods

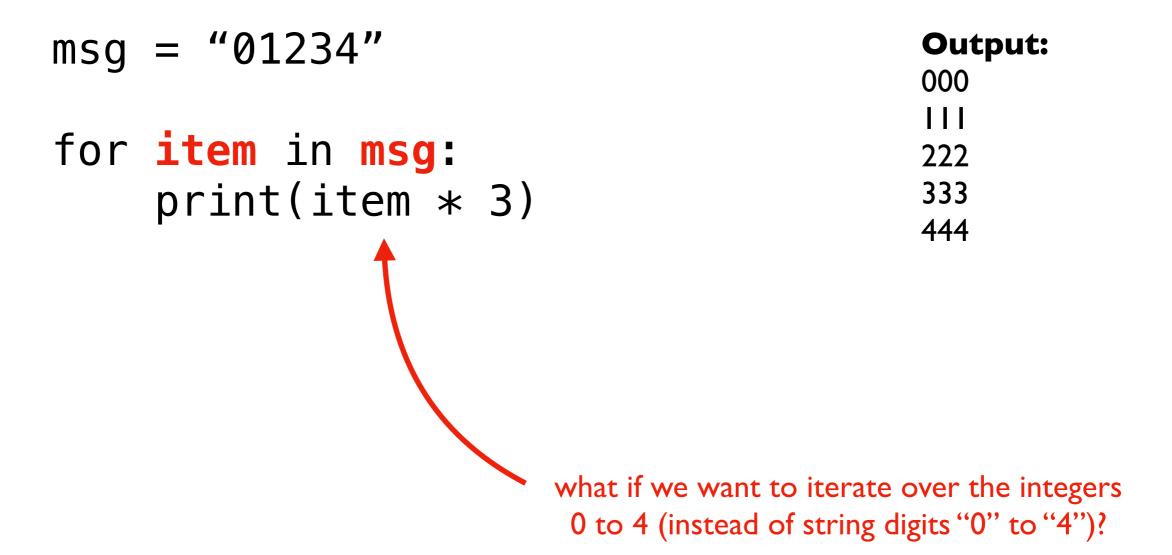

Sequences

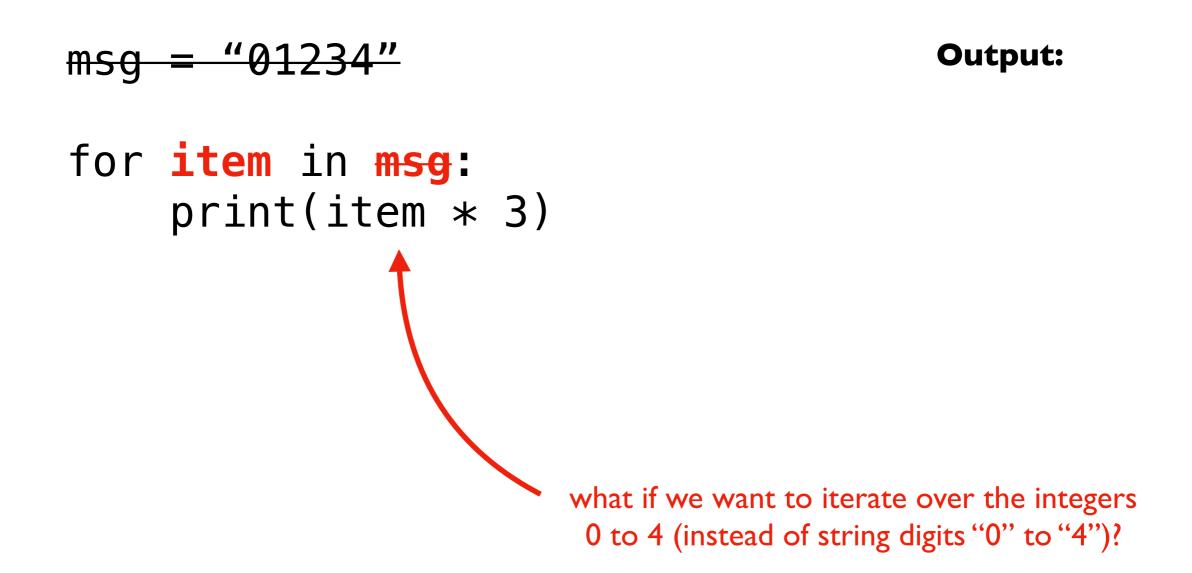

Slicing

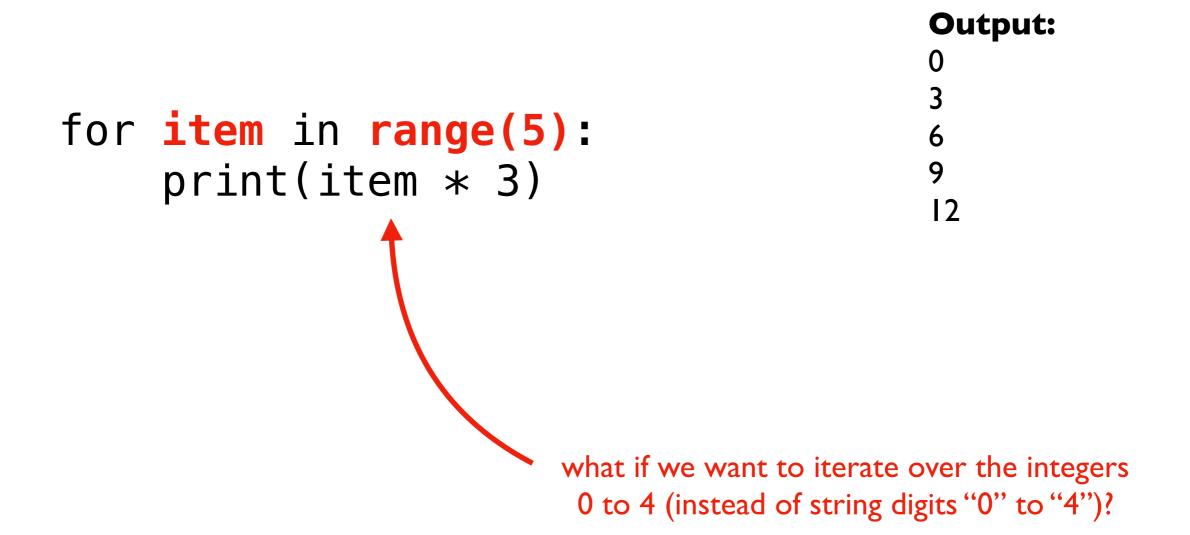

for loop over sequence

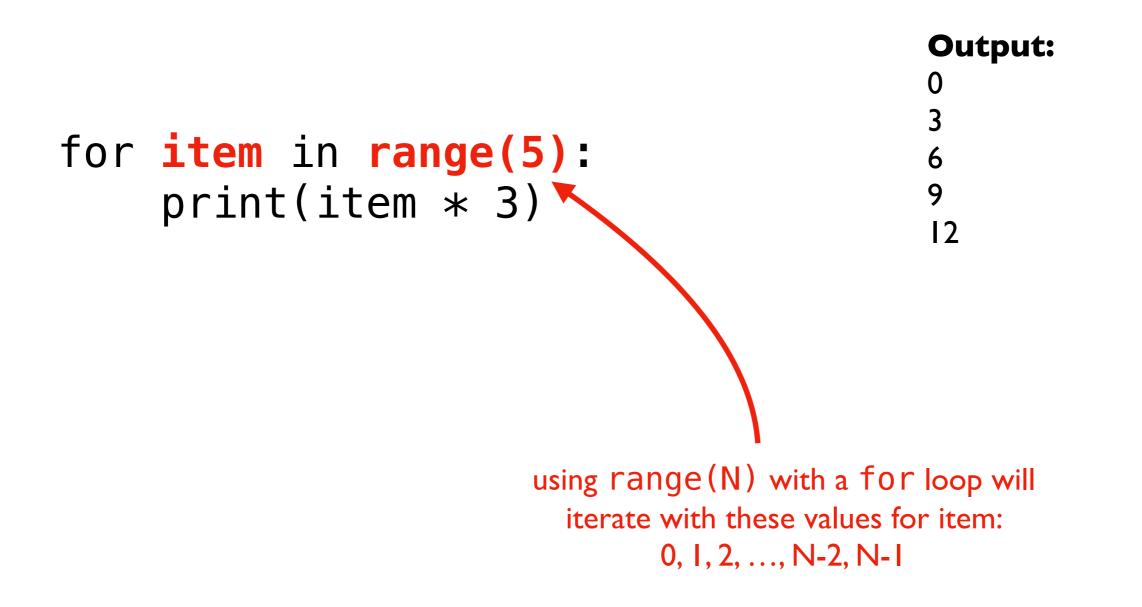

for loop over range

msg = "01234"	Output:
	000
- · ·	111
for item in msg:	222
<pre>print(item * 3)</pre>	333
	444

Do problem 6
