[301] Database I

Tyler Caraza-Harter

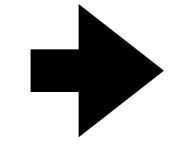

To download...

Wed: Database 1 (Nov 20)

- schemas/types
- queries
- where
- SQLite
- Querying from Pandas
- Link to Slides

Due: P9

Assigned: P10, Lab-P10a Lecture: code

	Fifa19.csv		
	README.txt		
(🖹 bus.db		download
	vocab.db		

301 Progress

Languages learned

- Python [Programming Language]
- HTML [Markup Language]

Data storage

- CSV files
- JSON files

301 Progress

Languages learned

- Python [Programming Language]
- HTML [Markup Language]
- SQL [Query Language]

Data storage

- CSV files
- JSON files
- SQL databases

structured query language

Learning Objectives Today

SQL Data

- schemas: tables, columns, types
- advantages over JSON/CSV

SQL Queries

- select, where, limit, sort by
- sqlite3 module
- Pandas/DB integration

Outline

Tabular Data: CSVs vs. Databases

Common SQL Databases

Example: Madison bus-route data

SQL: Structured Query Language

Demos

CSV

SQL Database

Stat	Capital	Populatio	Area
WI	Madison	5795000	65498
•••	•••	•••	•••

Characteristics

• one table

capitals

Stat	Capital
WI	Madison
•••	•••

populations

Stat	Population
WI	5795000
•••	•••

counties

Count	Рор	un_em
Dane	536416	0.02
•••	•••	•••

Stat Area WI 65498

areas

Characteristics

• collection of tables, each named

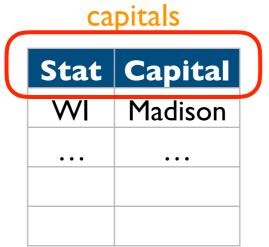

CSV

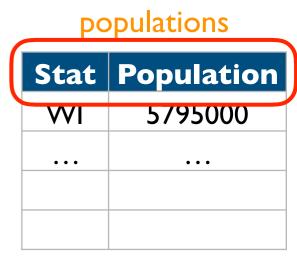

SQL Database

Stat	Capital	Populatio	Area
WI	Madison	5795000	65498
•••	•••	•••	•••

Characteristics

- one table
- columns sometimes named

Count Pop un_em Dane 536416 0.02

areas				
Stat	Area			
VVI	65498			
•••	•••			

Characteristics

- collection of tables, each named
- columns always named

CSV

Stat	Capital	Populatio	Area
string	string	string	string
string	string	string	string
string	string	string	string
string	string	string	string
string	string	string	string
string	string	string	string
string	string	string	string

Characteristics

- one table
- columns sometimes named
- everything is a string

capitals

Stat	Capital
text	text

populations

Stat	Population
text	integer

counties

Count	Рор	un_em
text	integer	real

areas

Stat	Area
text	integer

no text allowed

Characteristics

- collection of tables, each named
- columns always named
- types per column (enforced)

Why use a database?

I. More Structure

Database

Α	В	С
text	integer	real

same fields and same types in every column CSV

A,B,C string,string,string string,string,string string,string,string string,string,string

everything is a string

JSON

[{"A":"val", "B":10, "C":3.14}, {"A":"val"}, {"A":"v2", "B": 9, "C":False},

> types, but… missing values

types may differ across columns

Why use a database?

I. More Structure

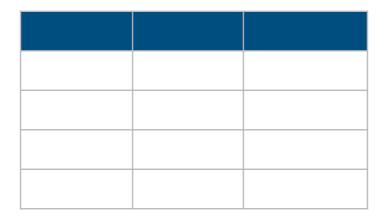

2. Sharing

Why use a database?

- I. More Structure
- 2. Sharing
- 3. Queries
- 4. Performance

Let's play a game where we pretend to be a database!

Question I:

How many people are 23 or younger?

Question 2:

How many people scored 23 or less?

names	age	score
Parker	? :	?
Heidy	?	?
Shirly	?	?
Arla	?	?
Bella	?	?
Bill	?	?
Hollis	?	?
Maurita	?	?
Milda	?	?
Pearline	?	?
Teresa	?	?
Ceola	?	?
Milford	?	?
Alisha	?	?
Antonetta	?	?
Ryan	?	?
Karma	?	?
Lashandra	?	?
Breana	?	?
Sara	?	? 🕇

Question I:

How many people are 23 or younger?

Question 2:

How many people scored 23 or less?

names	age	score
Parker	26	21
Heidy	22	22
Shirly	27	22
Arla	21	22
Bella	22	22
Bill	28	22
Hollis	26	23
Maurita	22	24
Milda	22	25
Pearline	29	25
Teresa	25	25
Ceola	30	26
Milford	25	26
Alisha	30	27
Antonetta	28	28
Ryan	25	28
Karma	23	28
Lashandra	24	29
Breana	22	30
Sara	28	30

Question I:

How many people are 23 or younger?

Question 2:

How many people scored 23 or less?

Which question took longer to answer? Why?

names	age	score
Parker	26	21
Heidy	22	22
Shirly	27	22
Arla	21	22
Bella	22	22
Bill	28	22
Hollis	26	23
Maurita	22	24
Milda	22	25
Pearline	29	25
Teresa	25	25
Ceola	30	26
Milford	25	26
Alisha	30	27
Antonetta	28	28
Ryan	25	28
Karma	23	28
Lashandra	24	29
Breana	22	30
Sara	28	30

DBs can keep multiple copies of the same data

- which organizations to use are configured (indexing)
- which copy to use is used is automatically determined based on the question being asked

names	age	score
Arla	21	22
Heidy	22	22
Bella	22	22
Maurita	22	24
Milda	22	25
Breana	22	30
Karma	23	28
Lashandra	24	29

Why use a database?

I. More Structure

- 2. Sharing
- 3. Queries
- 4. Performance

Why not use a database?

lt's often overkill.

For many situations, a simple JSON or CSV is easier to use.

Outline

Tabular Data: CSVs vs. Databases

Common SQL Databases

Example: Madison bus-route data

SQL: Structured Query Language

Demos

Popular SQL Databases

There are minor differences in how you use these (e.g., what column types are available and how you query for data).

Most experience with one DB will translate to work with other DBs.

Popular SQL Databases

in CS 301

https://www.sqlite.org/mostdeployed.html

- Every Android device
- Every iPhone and iOS device
- Every Mac
- Every Windows 10 machine
- Every Firefox, Chrome, and Safari web browser
- Every instance of Skype
- Every instance of iTunes
- Every Dropbox client

Why learn SQLite?

- easy to install/use
- sqlite3 module comes with Python
- it's public domain
- several billion deployments

File: bus.db

routes Table boarding Table how do we use this data?

Modules we've learned this semester

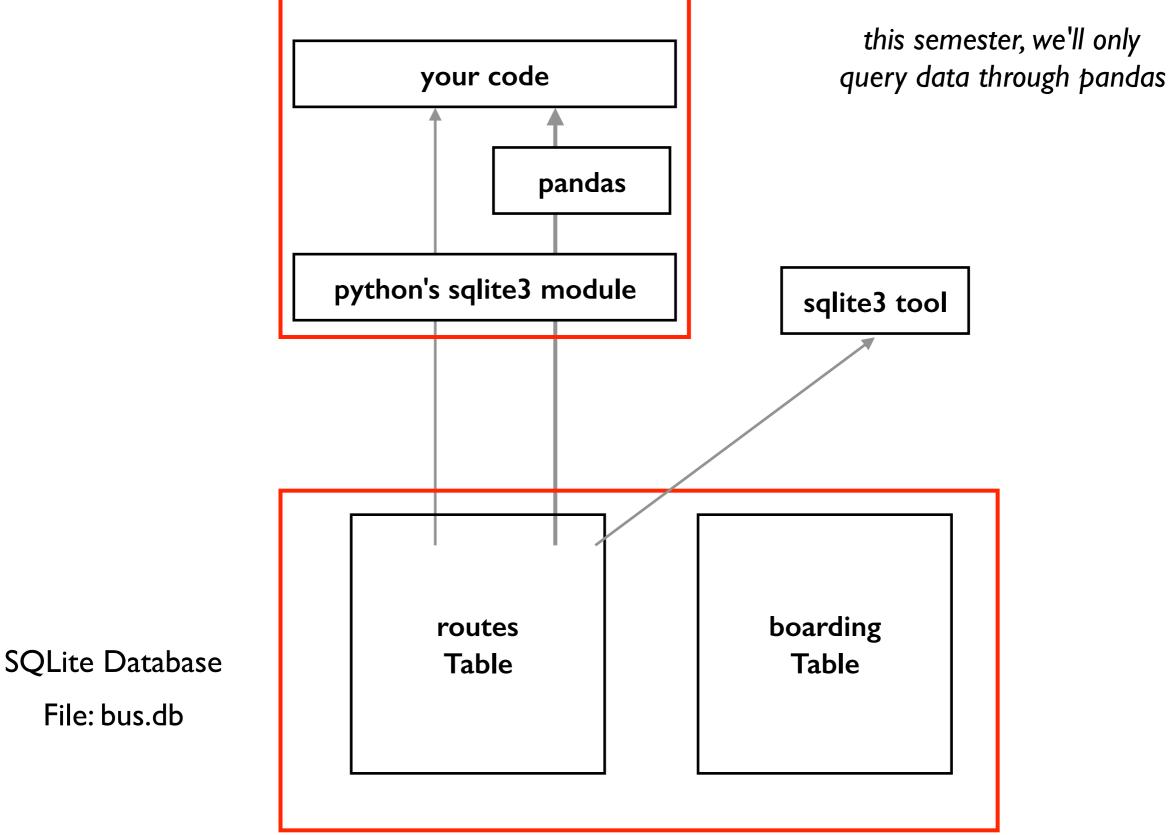

- math
- collections
- json
- CSV
- sys
- OS
- сору
- recordclass
- requests
- bs4 (BeautifulSoup)
- •

pandas *integrates* with SQLite

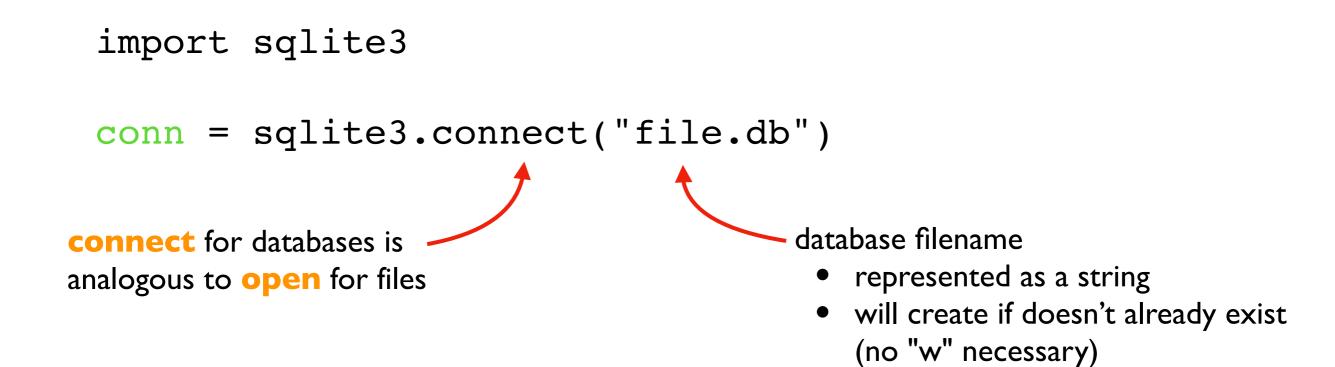

sqlite3

directly access SQLite databases (comes with Python)

python

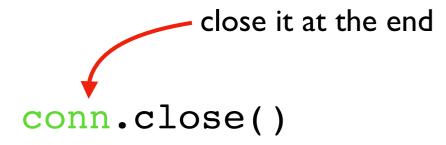

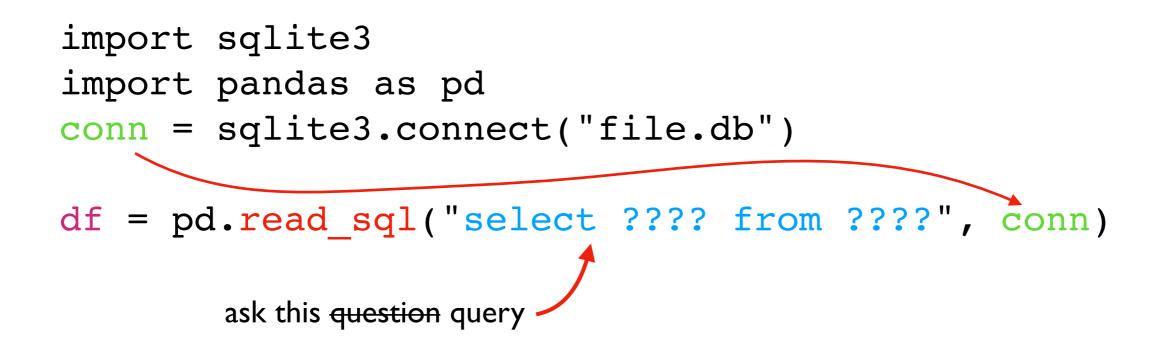

File: bus.db

```
import sqlite3
```

```
conn = sqlite3.connect("file.db")
```

```
conn.close()
```

```
1 import os, sqlite3
2
3 assert os.path.exists("bus.db")
4 sqlite3.connect("bus.db")
5
6 for sql in pd.read_sql("select sql from sqlite_master", conn)["sql"]:
7 print(sql)
8 print()
```

```
1 pd.read_sql("select * from routes", conn)
```

	index	OBJECTID	trips_routes_route_id	route_short_name	route_url	ShapeSTLength
0	0	63	8052	1	http://www.cityofmadison.com/Metro/schedules/R	32379.426524
1	1	64	8053	2	http://www.cityofmadison.com/Metro/schedules/R	96906.965571
2	2	65	8054	3	http://www.citvofmadison.com/Metro/schedules/R	76436.645644

1 pd.read_sql("select * from boarding", conn)

	index	StopID	Route	Lat	Lon	DailyBoardings
0	0	1163	27	43.073655	-89.385427	1.03
1	1	1163	47	43.073655	-89.385427	0.11
0	0	1160	75	40 0706EE	00 205 407	0.24

demo: poke around DB (will explain more soon)

CREATE TABLE IF NOT EXISTS "boarding" (

"index" INTEGER, "StopID" INTEGER, "Route" INTEGER, "Lat" REAL, table names "Lon" REAL, "DailyBoardings" REAL); CREATE INDEX "ix boarding index"ON "boarding" ("index"); **CREATE TABLE** IF NOT EXISTS "routes" ("index" INTEGER, "OBJECTID" INTEGER, "trips routes route id" INTEGER, "route short name" INTEGER, "route url" TEXT, "ShapeSTLength" REAL); CREATE INDEX "ix routes index"ON "routes" ("index");

CREATE TABLE IF NOT EXISTS "boarding" (

limit 3;
```

only show the top N results

	index	StopID	Route	Lat	Lon	DailyBoardings
Result:	1087	5	80	43.070947	-89.406982	317.94
	1088	10	80	43.075933	-89.400154	750.61
	1092	39	80	43.071895	-89.397341	628.88

3 results

```
select *
from boarding
where Route = 80
order by StopID ASC
limit 3;
```

	index	StopID	Route	Lat	Lon	DailyBoardings
Result:	1087	5	80	43.070947	-89.406982	317.94
	1088	10	80	43.075933	-89.400154	750.61
	1092	39	80	43.071895	-89.397341	628.88

Syntax for SELECT (case and spacing don't matter):

```
select *
from boarding
where Route = 80
order by StopID ASC
limit 3;
```

	index	StopID	Route	Lat	Lon	DailyBoardings
Result:	1087	5	80	43.070947	-89.406982	317.94
	1088	10	80	43.075933	-89.400154	750.61
	1092	39	80	43.071895	-89.397341	628.88

You can use any combination of where, order by, and limit. But whichever you use, they must appear in that order!

Outline

Tabular Data: CSVs vs. Databases

Common SQL Databases

Example: Madison bus-route data

SQL: Structured Query Language

Demos

Demo I: How Many People Ride the Bus

Goal: add up all boardings across all bus stops/routes

Input:

- bus.db
- use DailyBoardings column in boarding table

Output:

• total riders

Demo 2:West-most Bus Route

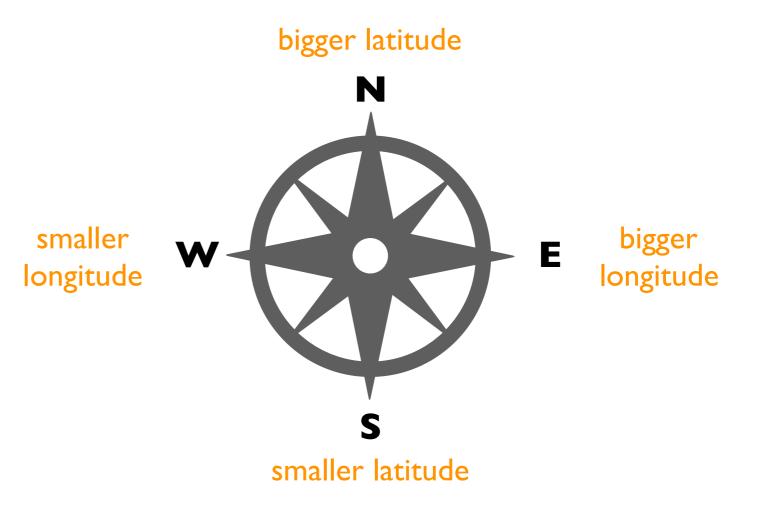

Goal: which Madison bus goes farthest west?

Input:

• bus.db

Output:

 route number of bus that goes farthest west

Demo 3: Heart of Madison

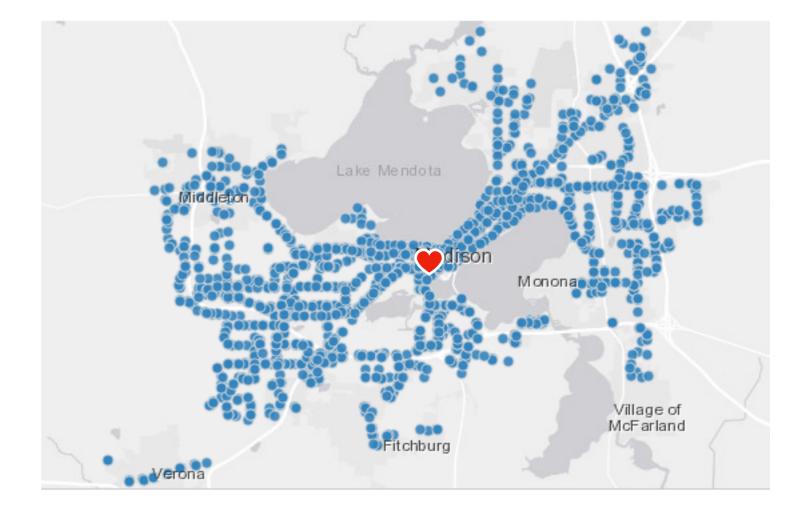

Goal: what is the central-most location of all bus pickups?

Input:

• bus.db

Output:

• a latitude and longitude

Demo 4: Fifa

Goal: load Fifa.csv to a SQLite DB, then query it

Queries:

- who are the youngest players?
- who are the oldest players?
- who are the five oldest players?
- how many players are from Brazil?
- who are the oldest players from Brazil?
- who are the 5 oldest players from Brazil?
- what percent of leagues have players from Brazil? DISTINCT

Demo 5:Vocabulary Quiz

Goal: quiz user on words looked up while reading a Kindle

Input (vocab.db):

- table of kindle words lookups
- table of definitions

Output:

- random word
- real definition
- fake definitions
